### Proposition

Let D and D' be homotopy equivalent objects of a dg-category  $\mathcal{D}$ . Let

$$
\begin{array}{ccc}\nD & \xrightarrow{f} & D' & g \circ f = 1_D - d\alpha \\
\alpha \underset{-1}{\circlearrowright} & D \xleftarrow{g} & D' \underset{-1}{\circlearrowleft} \beta & f \circ g = 1_{D'} - d\beta\n\end{array}
$$

be relevant data. Then there are  $\alpha'$  and  $\delta$ 

$$
D \xrightarrow{\text{f}} D'
$$
\n
$$
\alpha' \underset{-1}{\circ} D \xleftarrow{\text{g}} D' \underset{-1}{\circ} \beta
$$
\n
$$
\alpha' \underset{-1}{\circ} D \xleftarrow{\text{g}} D' \underset{-1}{\circ} \beta
$$
\n
$$
\alpha' \underset{-1}{\circ} D \xleftarrow{\text{g}} D' \underset{-1}{\circ} \beta
$$
\n
$$
\alpha' \underset{-1}{\circ} D \xleftarrow{\text{g}} D' \underset{-2}{\circ} D'
$$
\n
$$
\text{f} \circ \alpha' - \beta \circ \text{f} = d\delta.
$$

### Доведення.

We have  $f \circ \alpha - \beta \circ f \in Z^{-1}D(D, D')$  since

$$
d(f \circ \alpha - \beta \circ f) = f \circ (1 - g \circ f) + (f \circ g - 1) \circ f = 0.
$$

$$
\Rightarrow z := g \circ (f \circ \alpha - \beta \circ f) \in Z^{-1} \mathcal{D}(D, D),
$$
  
\n
$$
\alpha' := \alpha - z \Rightarrow g \circ f = 1_D - d\alpha'
$$

$$
f \circ \alpha' - \beta \circ f = f \circ \alpha - \beta \circ f - f \circ g \circ (f \circ \alpha - \beta \circ f)
$$
  
=  $f \circ \alpha - \beta \circ f - (1 - d\beta) \circ (f \circ \alpha - \beta \circ f) = (d\beta) \circ (f \circ \alpha - \beta \circ f)$   
=  $d[\beta \circ (f \circ \alpha - \beta \circ f)] =: d\delta.$ 

## Зворотні системи

Let C be a category. If the ordered set is  $N = \{1,2,3,...\}$  with the usual ordering, an inverse system (with values in the category C) over N is often simply called an inverse system. It consists quite simply of a pair  $(M_i, f_{ii'})$  where each  $M_i$ , i $\in$ N is an object of C, and for each i>i', i,i'∈N a morphism  $f_{ii'} : M_i \to M'_i$  such that moreover  $f_{i'i''} \circ f_{ii'} = f_{ii''}$  whenever this makes sense.

It is clear that in fact it suffices to give the morphisms  $M_2 \rightarrow M_1, M_3 \rightarrow M_2$ , and so on. Hence an inverse system is  $f$ requently pictured as follows  $M_1 \xleftarrow{\phi_2} M_2 \xleftarrow{\phi_3} M_3 \xleftarrow{\phi_4} \dots$ Moreover, we often omit the transition maps  $\phi_i$  from the notation and we simply say "let  $(M_i)$  be an inverse system". The collection of all inverse systems with values in C forms a category with the obvious notion of morphism.

If C is an additive category, then the category of inverse systems with values in C is an additive category.

If C is an abelian category, then the category of inverse systems with values in C is an abelian category.

A sequence  $(K_i) \rightarrow (L_i) \rightarrow (M_i)$  of inverse systems is exact if and only if each  $K_i \rightarrow L_i \rightarrow M_i$  is exact.

The limit of such an inverse system is denoted  $\lim M_i$ , or  $\lim M_i$ . If C is the category of abelian groups (or sets), then the limit always exists and in fact can be described as follows

$$
\lim_{i} M_{i} = \{ (x_{i}) \in \prod M_{i} \mid \phi_{i}(x_{i}) = x_{i-1}, i = 2, 3, \ldots \}.
$$

However, given a short exact sequence

$$
0 \to (A_i) \to (B_i) \to (C_i) \to 0
$$

of inverse systems of abelian groups it is not always the case that the associated system of limits is exact. In order to discuss this further we introduce the following notion.

### Definition (Умова Мітага-Лефлера)

Let C be an abelian category. We say the inverse system  $(A_i)$ satisfies the Mittag-Leffler condition, or for short is ML, if for every i there exists a  $c=c(i)$ >i such that for all k>c

$$
\operatorname{Im}(A_k\to A_i)=\operatorname{Im}(A_c\to A_i).
$$

It turns out that the Mittag-Leffler condition is good enough to ensure that the lim-functor is exact, provided one works within the abelian category of abelian groups, or abelian sheaves, etc.

#### Example

If  $(A_i, \phi_{ji})$  is a directed inverse system of sets or of modules and the maps  $\phi_{ii}$  are surjective, then clearly the system is Mittag–Leffler. Conversely, suppose  $(A_i, \phi_{ji})$  is Mittag–Leffler. Let  $A'_i \subset A_i$  be the stable image of  $\phi_{ji}(A_j)$  for  $j \ge i$ . Then  $\phi_{ji} | A'_j : A'_j \to A'_i$  is surjective for  $j \ge i$  and  $\lim A_i = \lim A'_i$ . Hence the limit of the Mittag–Leffler system  $(A_i, \phi_{ji})$  can also be written as the limit of a directed inverse system over I with surjective maps.

# Непорожність границі системи Мітага–Лефлера

#### Lemma

Let  $(A_i, \phi_{ji})$  be a directed inverse system over I. Suppose I is countable. If  $(A_i, \phi_{ji})$  is Mittag–Leffler and the  $A_i$  are nonempty, then  $\lim A_i$  is nonempty.

### Доведення.

Let  $i_1, i_2, i_3, \ldots$  be an enumeration of the elements of I. Define inductively a sequence of elements  $j_n \in I$  for  $n=1,2,3,...$  by the conditions:  $j_1 = i_1$ , and  $j_n \ge i_n$  and  $j_n > j_m$  for m $\le n$ . Then the sequence  $i_n$  is increasing and forms a cofinal subset of I. Hence we may assume  $I = \{1, 2, 3, ...\}$ .

So by previous Example we are reduced to showing that the limit of an inverse system of non-empty sets with surjective maps indexed by the positive integers is non-empty. This is obvious.

Система Мітага–Лефлера і коротка точна послідовність границь

#### Lemma

Let  $0 \to A_i \xrightarrow{f_i} B_i \xrightarrow{g_i} C_i \to 0$  be an exact sequence of directed inverse systems of abelian groups over I. Suppose I is countable. If  $(A_i)$  is Mittag-Leffler, then  $0 \to \lim A_i \to \lim B_i \to \lim C_i \to 0$ is exact.

Доведення. Taking limits of directed inverse systems is left exact, hence we only need to prove surjectivity of  $\lim B_i \to \lim C_i$ . So let  $(c_i) \in \lim C_i$ . For each i $\in I$ , let  $E_i = g_i^{-1}(c_i)$ , which is nonempty since  $g_i : B_i \to C_i$  is surjective. The system of maps  $\phi_{ii}: B_i \to B_i$  for  $(B_i)$  restrict to maps  $E_i \rightarrow E_i$  which make  $(E_i)$  into an inverse system of nonempty sets.

It is enough to show that  $(E_i)$  is Mittag-Leffler. For then previous Lemma would show  $\lim E_i$  is nonempty, and taking any element of  $\lim E_i$  would give an element of  $\lim B_i$  mapping to  $(c_i)$ .

By the injection  $f_i: A_i \to B_i$  we will regard  $A_i$  as a subset of  $B_i$ . Since  $(A_i)$  is Mittag-Leffler, if i∈I then there exists j≥i such that  $\phi_{ki}(A_k) = \phi_{ii}(A_i)$  for  $k \geq j$ . We claim that also  $\phi_{ki}(E_k) = \phi_{ii}(E_i)$ for k>j. Always  $\phi_{ki}(E_k) \subset \phi_{ii}(E_i)$  for k>j.

For the reverse inclusion let  $e_j \in E_j$ , and we need to find  $x_k \in E_k$ such that  $\phi_{ki}(x_k) = \phi_{ii}(e_i)$ .

Let  $e'_k \in E_k$  be any element, and set  $e'_j = \phi_{kj}(e'_k)$ . Then  $g_j(e_j - e'_j) = c_j - c_j = 0$ , hence  $e_j - e'_j = a_j \in A_j$ . Since  $\phi_{ki}(A_k) = \phi_{ii}(A_i)$ , there exists  $a_k \in A_k$  such that  $\phi_{ki}(a_k) = \phi_{ii}(a_i)$ . Hence

$$
\phi_{ki}(e_k'+a_k)=\phi_{ji}(e_j')+\phi_{ji}(a_j)=\phi_{ji}(e_j),
$$

so we can take  $x_k = e'_k + a_k$ .

#### Lemma

 $\Box$ 

Let  $0 \to (A_i) \to (B_i) \to (C_i) \to 0$  be a short exact sequence of inverse systems of abelian groups. Then In any case the sequence  $0 \to \lim_i A_i \to \lim_i B_i \to \lim_i C_i$  is exact. If  $(B_i)$  is ML, then also  $(C_i)$  is ML. If  $(A_i)$  is ML, then  $0 \to \lim_i A_i \to \lim_i B_i \to \lim_i C_i \to 0$  is exact. Proof. (1)  $\lim : Ab^{I^{op}} \to Ab$  is right adjoint to const :  $Ab \to Ab^{I^{op}}, X \mapsto (X)_i.$ (2) follows from surjectivity of all  $g_i : B_i \to C_i$ :  $\forall i \exists j \ge i \forall k \ge j$ 

 $\text{Im}(C_k \rightarrow C_i) = g_i(\text{Im}(B_k \rightarrow B_i)) = g_i(\text{Im}(B_i \rightarrow B_i)) = \text{Im}(C_i \rightarrow C_i)$ .

#### Lemma

Let

$$
(A_i)\to (B_i)\to (C_i)\to (D_i)
$$

be an exact sequence of inverse systems of abelian groups. If the system  $(A_i)$  is ML, then the sequence

$$
\mathop{\text{lim}}_i B_i \to \mathop{\text{lim}}_i C_i \to \mathop{\text{lim}}_i D_i
$$

is exact.

### Доведення.

Let  $Z_i = \text{Ker}(C_i \rightarrow D_i)$  and  $I_i = \text{Im}(A_i \rightarrow B_i)$ . Then  $\lim Z_i = \text{Ker}(\lim C_i \to \lim D_i)$  and we get a short exact sequence of systems

$$
0 \to (I_i) \to (B_i) \to (Z_i) \to 0
$$

Moreover, by previous Lemma we see that  $(I_i)$  has  $(ML)$ , thus another application of previous Lemma shows that  $\lim B_i \to \lim Z_i$  is surjective which proves the lemma.

## Правий похідний функтор

In this section  $\mathscr C$  and  $\mathscr C'$  will denote two abelian categories, and  $F: \mathscr C \to \mathscr C'$  and additive functor.

We shall denote by O the natural functor  $K^+(\mathscr{C}) \rightarrow D^+(\mathscr{C})$  or  $K^+(\mathscr{C}) \rightarrow D^+(\mathscr{C})$ .

**Definition 1.8.1.** Let  $T: D^+(\mathscr{C}) \to D^+(\mathscr{C})$  be a functor of triangulated categories, and let s be a morphism of functors:

 $s: Q \circ \mathsf{K}^+(F) \to T \circ Q$ ,

where  $K^+(F): K^+(C) \to K^+(C')$  is the functor naturally associated to F. Assume that for any functor of triangulated categories  $G : D^+(\mathscr{C}) \to D^+(\mathscr{C})$ , the morphism:

$$
Hom(T, G) \longrightarrow Hom(Q \circ \mathsf{K}^{+}(F), G \circ Q)
$$

is an isomorphism.

Then  $(T, s)$ , which is unique up to isomorphism, is called the right derived functor of F, and denoted RF. The functor  $H^n \circ RF$ , also denoted  $R^nF$ , is called the n-th derived functor of  $F$ .

Let us give a useful criterium which ensures the existence of  $RF$ . From now on and until Proposition 1.8.7, we assume  $F$  is left exact.

### F-ін'єктивна підкатегорія

**Definition 1.8.2.** A full additive subcategory  $\mathcal{I}$  of  $\mathcal{C}$  is called injective with respect to  $F$  (or  $F$ -injective, for short), if :

- (1.7.5) for any  $X \in Ob(\mathscr{C})$ , there exists  $X' \in Ob(\mathscr{I})$  and an exact sequence  $0 \rightarrow X \rightarrow X'$ .
- (ii) if  $0 \to X' \to X \to X'' \to 0$  is an exact sequence in *C*, and if X' and X are in  $Ob(\mathcal{I})$ , then X" is also in  $Ob(\mathcal{I})$ ,
- (iii) if  $0 \to X' \to X \to X'' \to 0$  is an exact sequence in  $\mathcal{C}$ , and if X', X, X'', are in  $Ob(\mathcal{I})$ , then the sequence  $0 \to F(X') \to F(X) \to F(X'') \to 0$  is exact.

Note that under conditions (i) and (ii), the condition (iii) is equivalent to the similar condition in which one only assumes  $X' \in Ob(\mathcal{I})$ , because of the assumption that  $F$  is left exact.

Let  $\mathcal I$  be F-injective. Then one can check easily that F transforms objects of  $K^+(\mathscr{I})$  quasi-isomorphic to zero into objects of  $K^+(\mathscr{C})$  satisfying the same property

## Існування правого похідного функтора

property. Therefore the composition of functors

$$
\mathbf{K}^+(\mathscr{I}) \xrightarrow{\mathbf{K}^+(F)} \mathbf{K}^+(\mathscr{C}') \xrightarrow{\hspace*{1cm}} \mathbf{D}^+(\mathscr{C}')
$$

factors through  $K^+(\mathcal{I})/\mathcal{N} \cap Ob(K^+(\mathcal{I}))$  where N is given by acyclic complexes. Since  $\mathsf{K}^+(\mathscr{I})/\mathscr{N} \cap \mathrm{Ob}(\mathsf{K}^+(\mathscr{I}))$  is equivalent to  $\mathsf{D}^+(\mathscr{C})$  by Proposition 1.7.7, we obtain:

**Proposition 1.8.3.** Assume there exists an F-injective subcategory  $\mathcal{I}$  of  $\mathcal{C}$ . Then the functor from  $K^+(\mathcal{I})/\mathcal{N} \cap Ob(K^+(\mathcal{I}))$  to  $D^+(\mathcal{C}')$  constructed above is the right derived functor of F.

**Remark 1.8.4.** It follows from the universal property of RF that the preceding construction does not depend on  $\mathcal{I}$ .

**Remark 1.8.5.** Let  $\mathcal{I}$  be the full subcategory of injective objects of  $\mathcal{C}$  and assume  $\mathscr C$  has enough injectives, (i.e: (1.7.5) is satisfied). Then  $\mathscr I$  is F-injective with respect to any left exact functor F, since any sequence in  $\mathcal I$  splits, (cf. Exercise I.5). In particular  $RF$  always exists in this case.

# Гомотопійна границя

In a triangulated category there is a notion of derived limit.

### Definition

Let  $\mathcal D$  be a triangulated category. Let  $(K_n, f_n : K_n \to K_{n-1})$  be an inverse system of objects of  $D$ . We say an object K is a derived limit, or a homotopy limit of the system  $(K_n)$  if the product  $\prod K_n$  exists and there is a distinguished triangle

# $K \to \prod K_n \to \prod K_n \to K[1]$

where the map  $\prod K_n \to \prod K_n$  is given by  $(k_n) \mapsto (k_n - f_{n+1}(k_{n+1}))$ . If this is the case, then we sometimes indicate this by the notation  $K = R \lim K_n$ .

By TR3 a derived limit, if it exists, is unique up to (non-unique) isomorphism. Moreover, by TR1 a derived limit R  $\lim K_n$  exists as soon as  $\prod K_n$  exists. The derived category  $\mathrm{D}(\mathrm{Ab})$  of the category of abelian groups is an example of a triangulated category where all derived limits exist.

#### Lemma

Let  $A$  be an abelian category with countable products and enough injectives. Let  $(K_n)$  be an inverse system of  $D^+(\mathcal{A})$ . Then  $R \lim K_n$  exists.

### Доведення.

It suffices to show that  $\prod K_n$  exists in D(A). For every n we can represent  $K_n$  by a bounded below complex  $I_n^{\bullet}$  of injectives. Then  $\prod K_n$  is represented by  $\prod I_n^{\bullet}$ .

#### Lemma

The functor  $\lim : Ab^{\text{Nop}} \to Ab$  has a right derived functor

$$
R\mathop{\text{\rm lim}}: D(\mathrm{Ab}^{\mathbb{N}^{op}}) \longrightarrow D(\mathrm{Ab})
$$

As usual we set  $\mathbb{R}^p$  lim $(K) = \mathrm{H}^p(\mathrm{R}\lim(K))$ . Moreover, we have

- 1. for any  $(A_n)$  in  $Ab^{\text{pop}}$  we have  $R^p$  lim  $A_n = 0$  for  $p > 1$ ,
- 2. the object R lim  $A_n$  of  $D(Ab)$  is represented by the complex

$$
\prod A_n \to \prod A_n, (x_n) \mapsto (x_n - f_{n+1}(x_{n+1}))
$$

sitting in degrees 0 and 1,

- 3. if  $(A_n)$  is Mittag-Leffler, then  $R^1$  lim  $A_n = 0$ , i.e.,  $(A_n)$  is right acyclic for lim,
- 4. every  $K^{\bullet} \in D(Ab^{\text{Nop}})$  is quasi-isomorphic to a complex whose terms are right acyclic for lim, and
- 5. if each  $K^p = (K_n^p)$  is right acyclic for lim, i.e., of  $R^1$  lim<sub>n</sub>  $K_n^p = 0$ , then R lim K is represented by the complex whose term in degree p is  $\lim_{n} K^p_n.$

Proof. Let  $(A_n)$  be an arbitrary inverse system. Let  $(B_n)$  be the inverse system with

$$
B_n=A_n\oplus A_{n-1}\oplus \ldots \oplus A_1
$$

and transition maps given by projections. Let  $A_n \to B_n$  be given by  $(1, f_n, f_{n-1} \circ f_n, \ldots, f_2 \circ \ldots \circ f_n)$  where  $f_i : A_i \to A_{i-1}$  are the transition maps. In this way we see that every inverse system is a subobject of a ML system. It follows that every ML system is right acyclic for lim, i.e., (3) holds. This already implies that RF is defined on  $D^+(Ab^{\mathbb{N}^{op}})$ . Set  $C_n = A_{n-1} \oplus ... \oplus A_1$  for  $n>1$  and  $C_1 = 0$  with transition maps given by projections as well. Then there is a short exact sequence of inverse systems  $0 \to (A_n) \to (B_n) \to (C_n) \to 0$  where  $B_n \to C_n$  is given by  $(x_i) \mapsto (x_i - f_{i+1}(x_{i+1}))$ . Since  $(C_n)$  is ML as well, we conclude that (2) holds which also implies (1). Finally, this implies that R lim is in fact defined on all of  $D(Ab^{\text{Nop}})$ . In fact, one proceeds by proving assertions (4) and  $(5). \square$ 

Let  $\mathcal S$  be a triangulated category. Suppose  $X_i$ ,  $i \in \mathbb N$ , is a sequence of objects in  $S$ , together with maps  $f_i: X_{i+1} \to X_i$ . Then  $\forall n \in \mathbb{N}$  there is a split exact sequence in S

$$
\begin{aligned} 0\to X_{n+1} &\stackrel{q}{\longrightarrow} \prod_{i=1}^{n+1} X_i \stackrel{\text{pr}-\text{shift}}{\longrightarrow} \prod_{i=1}^n X_i\to 0,\\ \text{shift}=&\bigg(\prod_{i=1}^{n+1} X_i \stackrel{\text{pr}}{\longrightarrow} \prod_{i=2}^{n+1} X_i \stackrel{\prod_{i=1}^n f_i}{\longrightarrow} \prod_{i=1}^n X_i\bigg), \end{aligned}
$$

$$
\text{pr}-\text{shift} = \begin{pmatrix} 1 & & & & & \\ -f_1 & 1 & & & & \\ & -f_2 & 1 & & & 0 \\ & & \ddots & \ddots & \ddots & \\ & & & -f_{n-1} & 1 \\ & & & & -f_n \end{pmatrix}, \\ q = (f_n \dots f_1, \dots, f_nf_{n-1}, f_n, 1).
$$

Splitting is determined by  $\mathsf{pr}_{n+1}: \prod_{i=1}^{n+1} X_i \to X_{n+1}.$ 

The diagram commutes

If  $S = D(\mathcal{A})$ , where abelian category satisfies AB5<sup>\*</sup>), the filtered limit of rows would be an exact sequence in  $C(\mathcal{A})$ 

$$
0 \to \lim_{i \in \mathbb{N}} X_i \longrightarrow \prod_{i=1}^{\infty} X_i \xrightarrow{1-\text{shift}} \prod_{i=1}^{\infty} X_i \to 0,
$$

However, Ab and R-mod do not satisfy AB5\*).

For any chain map  $f : X \to Y$  there are

$$
Cone(-f: X \to Y) = \left(X[1] \oplus Y, \begin{pmatrix} d_{X[1]} & -\sigma^{-1} \cdot f \\ 0 & d_Y \end{pmatrix}\right),
$$

$$
Cone(Y \to Cone(-f : X \to Y))
$$
  
=  $\left(Y[1] \oplus X[1] \oplus Y, \begin{pmatrix} d_{Y[1]} & 0 & \sigma^{-1} \\ 0 & d_{X[1]} & -\sigma^{-1} \cdot f \\ 0 & 0 & d_{Y} \end{pmatrix}\right)$ ,

$$
Z = \text{Cone}(Y \to \text{Cone}(-f : X \to Y))[-1]
$$
  
=  $\left(Y \oplus X \oplus Y[-1], \begin{pmatrix} d_Y & 0 & -\sigma^{-1} \\ 0 & d_X & f \cdot \sigma^{-1} \\ 0 & 0 & d_{Y[-1]} \end{pmatrix}\right)$ ,  

$$
d_{Y[-1]} = -\sigma \cdot d_Y \cdot \sigma^{-1}.
$$

$$
X \xleftarrow{\text{(f 1 0)}} \begin{pmatrix} Y \oplus X \oplus Y[-1], \begin{pmatrix} d_Y & 0 & -\sigma^{-1} \\ 0 & d_X & f \cdot \sigma^{-1} \\ 0 & 0 & d_{Y[-1]} \end{pmatrix} \end{pmatrix} \xrightarrow{\text{(1)}{0}} Y.
$$

Morphisms on the left are homotopy inverse to each other since

$$
\begin{pmatrix} f & 1 & 0 \end{pmatrix} \cdot \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix} = 1,
$$
  

$$
\begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix} \cdot \begin{pmatrix} f & 1 & 0 \end{pmatrix} = 1_Z + hd_Z + d_Zh,
$$
  
where  $h = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ \sigma & 0 & 0 \end{pmatrix} : Z \to Z,$  deg  $h = -1.$ 

The map f decomposes into homotopy equivalence and a bration (surjection in all degrees)

$$
f = \Big(X \xrightarrow{\text{(f 1 0)}} Z \xrightarrow{\begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix}} Y\Big).
$$

Iterating this procedure we can replace the sequence (fi) of chain maps of complexes of abelian groups

with a sequence  $(g_i)$  of fibrations such that the vertical maps (hi) are homotopy equivalences. By definition, in the sense of model categories

<span id="page-22-0"></span>
$$
\mathsf{holim}_{i}(f_{i})=\mathsf{holim}_{i}(g_{i})=\mathsf{lim}(g_{i}).
$$

Since the sequence  $(g_i)$  is Mittag-Leffler we have a short exact sequence of complexes

$$
0 \to \underset{i \in \mathbb{N}}{\text{lim}} (g_i) \longrightarrow \ \underset{i=1}{\overset{\infty}{\prod}} \, Z_i \overset{1-\text{shift}}{\longrightarrow} \ \underset{i=1}{\overset{\infty}{\prod}} \, Z_i \to 0,
$$

which implies that in the sense of triangulated categories  $K' = \text{holim}_{i}(g_{i})$  comes from a triangle in D(Ab)

$$
K' = \underset{i \in \mathbb{N}}{\text{lim}}(g_i) \to \prod_i Z_i \xrightarrow{1-\text{shift}} \prod_i Z_i \to K'[1]
$$

isomorphic in D(Ab) to

$$
K = \text{holim}_{i \in \mathbb{N}}(f_i) \to \prod_i X_i \xrightarrow{i-\text{shift}} \prod_i X_i \to K[1].
$$

Hence, in the sense of triangulated categories  $K = \text{holim}_{i \in \mathbb{N}}(f_i) \cong K' = \text{lim}_{i \in \mathbb{N}}(g_i)$  in D(Ab). The same conclusion for any diagram  $(1)$  with quasi-isomorphisms h<sub>i</sub> and fibrations  $g_i$ . Thus, the two approaches to holim agree.
